Problem Statement

Problem Definition

Some of our strongest geographic and cultural associations are tied to a region's local foods. This playground competitions asks you to predict the category of a dish's cuisine given a list of its ingredients.

- train data

Table 1: The head of the train data

	cuisine	id	ingredients
0	greek	10259	[romaine lettuce, black olives, grape tomatoes...
1	southern_us	25693	[plain flour, ground pepper, salt, tomatoes, g...
2	filipino	20130	[eggs, pepper, salt, mayonaise, cooking oil, g...
3	indian	22213	[water, vegetable oil, wheat, salt]
4	indian	13162	[black pepper, shallots, cornflour, cayenne pe...

- Display the data set

Table 2: The head of the test data

	id	ingredients
0	18009	[baking powder, eggs, all-purpose flour, raisi...
1	28583	[sugar, egg yolks, corn starch, cream of tarta...
2	41580	[sausage links, fennel bulb, fronds, olive oil...
3	29752	[meat cuts, file powder, smoked sausage, okra,...
4	35687	[ground black pepper, salt, sausage casings, l...

Text Preprocessing

Preprocessing

- stopwords
- regularization
- convert to lowercase letters

Since my text data is relatively clean, I only used the stopwords method

visualization

By using wordcloud to discribe the frequency of text data.

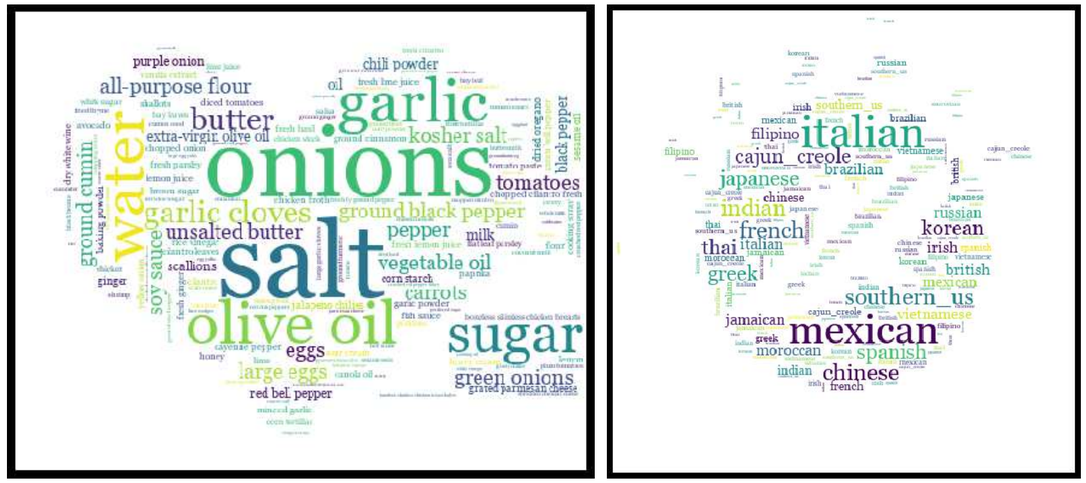

Figure 1: Displaying the words in text

Text feature extraction

Replace text labels in the data set with numbers. Transform text in feature values into word vectors.

- unique() and apply()
- word2vec

Replace text labels

By using the unique() and apply() can replace the texe label into figures.

Table 3: Replace the text label

	cuisine	label
0	irish	16
1	italian	6
2	irish	16
3	chinese	8
4	mexican	7

word2vec

Use word2vec to convert text to word vectors. And convert word vectors to sentence vector.and then for each sentence vector we have one label for it.

- vector size 300
- mean

Modeling

Modeling

- problem analysis

  This is a text classification problem.we can use many ways to solve text classification problems.

- Logistic Regression
- KNN
- Random forest
- SVM
- CNN

Step

- Divide training data and test data
- Do a model training
- Model evaluation
- Model prediction

The score of models

Table 4: The score of models

	model	score
1	Logistic Regression	0.729
2	KNN	0.740
3	Random forest	0.739
4	SVM	0.736
5	CNN	0.753

Conclusion

Conclusion

1 Using the Word2vec to help us process the textdata.If the text data is Chinese, we can use jieba for word segmentation.

2 There are many ways to deal with text classification in machine learning .we can select suitable ways on combination with the problem.

3 In this problem, i use the mean of each words vector to caculate the sentence vector. Maybe this is the question why accuracy is lower than my espect
